BusinessData
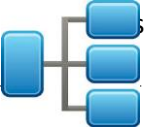

Reference Data Management

One common reference data module for all Appian applications. Create domains for data, control access permissions / attributes.

Change Business Data With Ease

Intuitive UI to search for, and update business data. Access control changes at domain level all the way to individual attributes.

Simple to integrate

The SAIL developer just needs to reference a plugin function for using business data in place of using constants. Simple, but Powerful!

Persistent Systems' BusinessData Solution enables business users to manage reference data, eliminating the need for a deployment cycle to update business information on live Appian applications.

Business users can update business and reference data (e.g., thresholds, business values that impact workflows, dropdown values etc) by leveraging the comprehensive, access-controlled BusinessData Management module. Appian applications would pick up the business data changes in real-time.

Persistent's BusinessData Solution enables Organizations to manage all business and reference data used in Appian applications

Faster SAIL Form Loads

The custom plugin functions maintain a cache. Caching ensures that the relevant reference data is accessed faster.

Find Business Data

Developers and Business Users can search the Business Data and reuse existing reference data

Good User Experience

Business users can see the different versions of Business Data, and update as needed.
